Shetty, J., Malek, J., Koo, H., Collins, F., Gardner, M. and Loftus, B. J. Direct Submission of BAC-end sequences from Anopheles gambiae
                                                                                                                                                                                                                                                                                            This clone is from an A. gambiae BAC library (ND-TAM) provided by F.H. Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas AAM University BAC Center University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       140 IleTyrArgProAlaAlaIleAsnGlnLeuGlnThrValGlyLysGlnIleAspIlePro 159

Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_IBSOF_flowers pre-fertilized

Colletotrichum graminicola"

Colletotrichum graminicola"

Note="Vector: pBuescript II SK(-) from Lambda Zap II;
Site_1: XhOi; Site_2: BcoRI; Four-week-old sorghum
seedilings were sprayed with spore suspension prepared from
3-week-old FRW42I, a sorghum isolate of the anthracnose
pathogen Colletotrichum graminicola. Incoulated plants
were kept in a 25 c dark growth chamber with 100% relative
humidity for 24 hr, followed by 12/12 hr of light/dark
cycle at 25 c with 90% relative humidity for another 24
hr. All leaves were harvested and quick frozen with liquid
nitrogen and stored in a -80 C freezer. The library was
made from poly-A RNA in the cloning vector lambda ZAP II.
Clones to be sequenced were prepared by mass excision.
WARNING: While most or all ESTs are expected to derive
from the host plant, no effort was made to eliminate ESTs
deriving from the pathogen."
below Phred quality 16. The threshold for highest quality sequence is 20. Three-prime sequences, which are obtained with PolyTMix or T7 sequencing primer, are presented as the reverse complement. Seq primer: JEN REV High quality sequence stop: 454
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  334 PheLeuGluGlnLeuAspGlnValLysAsnLeuGlyProLeuAspAspIleMetLysMet 353
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AspThrArgGlyGlyAlaAlaLeuSerIleArgSerValThrGlnLysProIleLysPhe 273

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ
                                                                      This sequence is the Staphylococcus aureus signal recognition particle (SRP) fih component. Fih polynucleotides are useful for diagnosing a disease related to expression of fih polypeptides by analysing for the presence/amount of fih protein in a sample due to infection of a micro-organism with the gene, or determining the nucleic acid sequence encoding fih. Fih polypeptides and antagonists are useful for treatment of an individual in need (polypeptides are useful for inhibit (antagonist) fih polypeptide levels. Fih polypeptides and antagonists by binding and observing the affect of fifth polypeptide activity, which are potential anti-microbial agents. Fih polypeptides and antigenic fragments are also useful for inducing an immunological response (T cell/antibody) to protect against disease, by direct administration (vaccine), or via a vector (gene therapy). Anti-fih antibodies are useful as antagonists, and for protecting against disease. Diseases diagnosed, prevented and treated include those caused by infection, especially bacterial infection, include those caused by infection, especially bacterial infection, and including outlis media, conjunctivitis, toxic shock syndrome, wound are useful for bathing wounds and implants prior to surgical
                                                                                                                                                                                                                                                                                                                                                                                              ;

```
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are preunohase, Pseudomonas acrupinosa and Enterococcus facalls. The preunohase, Pseudomonas acrupinosa and Enterococcus facalls. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WiPo at.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 LGSDVMQSLTPGQQVIKIVQDELTKLMGGENTSINMSNKPPTVVMMVGLQGAGKTTTAGK 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δý
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aurens, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins.

The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               240

The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and blodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene, expression and cell replication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and modulate L. monocytogenes related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                           RESULT 5
                                                                                                                                   ABB49131
                                                                                                                                                                                                            Qγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Bscherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen a wide variety of organisms. The present sequence is also useful to screen essential prokaryotic cellular proliferation protein.

So wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Wote: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formet directly from MIPPO at the contract of the printed specification, but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to
                                                                                                                                                                                             240

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are scenariolia coli, staphylococcus aureus, Salmonella typhi, Ribabiella premoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets or antibiotic development. The antissense nucleic acids can also be used to infentify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins, the programmes. The antissense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ŏ
                                                                                                                           The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotse used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella preumoniae, pseudomonas aeruginosa and Enterococcus facealis. The promarion is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to invention is also useful for the identification, to express these proteins. Community proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                           5
                                                                                                                                                        programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO.
The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to obtain antibodies capable of binding to the expressed proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                          PALQNMKVDERQIARKRAIVSSWIPPERENPDLLNPSRRRRIAAGSGNTFVEVNKFIKDF 420

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are schemically staphylococcus aureus, Salmonella typhi, Klebsiella promuoniae, Pseudomonas aeruginosa and Enterococus faccalis. The prokaryotic development. The antisense nucleic acids can also be used to antibiotic development. The antisense nucleic acids can also be used to chemity proteins used in proliferation, to express these proteins.

The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen to homelogous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

The printed specification, the present sequence represents an essential prokaryotic cellular proliferation protein.

ris pressor, invention teaches to include a data (which are essential for the viability of a bacterial cell wall. The acronym CFE stands for "CEG For Expression", where CEG stands for "Conserved Essential Gene". The nucleic acids are useful for detecting the presence of proteins essential for the viability of a bacterial cell wall in samples such as cells, tissues, blotogical fluids, blood, serum, nose, ear or throat swabs with ligands, and for detecting corresponding target nucleic acid molecules with complementary sequences. The nucleic acids are also useful for determining whether a genomic nucleic acids are also useful for determining whether a genomic nucleic acids are also useful for determining whether a genomic nucleic desequence of interest is essential for viability of a bacterial cell or whether it resides within an operon, by integrating an exogeneous nucleotide sequence of interest comprising 20°-500 base pairs) into the genomic sequence of interest which confers a selection agent such as chloramhenicol. The nucleic cell cidentification of showers and for treating bacterial infections with gene therapy and antisense therapy. The nucleic acids antibiotic resistant bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding conserved essential genes involved in bacterial replication which are potential targets for the treatment of antibiotic

This sequence is the Staphylococcus aureus signal recognition particle (SRP) fife Component. Fife polynucleotides are useful for diagnosing a disease related to expression of fife polypeptides by analysing for the presence/amount of fife protein in a sample due to infection of a micro-organism with the gene, or determining the nucleic acid sequence encoding ffh. Fife polypeptides and antagonists are useful for treatment of an individual in need (polypeptide) of, or needing to inhibit (antagonist) fife polypeptides and antagonists are useful for identifying agonists and antagonists by binding and observing the affect of fife polypeptide activity, which are polypucleotides are useful for identifying agonists and antagonists by binding and observing the affect of fife polypeptide activity, which are constituted anti-incrobial agents. Frh polypeptides and antigonists by binding and observing the affect of fife polypeptides and antigonists, are also useful for inducing an immunological response (T cell/antibody) to protect against disease, by direct administration (vaccine), or via a correct against disease. Diseases diagnosed, prevented and treated include those caused by infection, especially bacterial infection, include those caused by infection, especially bacterial infection, and infection and septic arthritis. Futh polypeptides are antimicrobial, and are useful for bathing wounds and implants prior to surgical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;

The present sequence represents the Streptococcus pneumoniae fifty-four homologue (ffh) protein, which is a component of the protein secretory apparatus in Bacteria, and the bacterial homologue of the eukaryotto Signal Recognition Particle. Fifth proteins and polynucleotides are useful of diagnosing diseases related to over or underexpression of Ffh protein or instances of the eukaryotta of the Fff gene, or determining Ffh protein or mRNA expression levels due to an infection of an organism with the Ffh gene. They can diagnose the stage and type of infection. Ffh proteins are also useful for screening for compounds which affect activity of the protein by measuring the binding to fifth protein and observing the stimulation or inhibition of the protein function. These can be used in treatment to inhibit (antagonist i.e. antibacterial drugs) or enhance cannotist. Ffh activity, in addition to direct administration of Ffh proteins (administration of antisense sequences to prevent expression. Ffh proteins (administration of antisense sequences to prevent expression. Ffh proteins (administration of antisense sequences to prevent disease. Content and as a vaccine) and antibodies induce an immune response to immunise and prevent disease. Conjunctivitis, bacteraemia, sinusitis, pleural empyema, endocarditis and especially meningitis. Ffh proteins, polynucleotides and their conjunctivitis, bacteraemia, sinusitis, pleural empyema, endocarditis and especially meningitis. Ffh proteins, polynucleotides and their can prevent adhesion of bacterial to prevent bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      181 KEEHLDFVIIDTAGRLHIDEALMNELKEVKEIAKPNEIMLVVDSMTGQDAVNVABSFDDQ 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a new use of a compound that activates or inhibits a polypeptide that is at least 90% identical with a 523 amino acid sequence, defined in the specification, for treatment of bacterial infection. The invention can be used to treat infections caused by Staphylococcus or Streptococcus, particularly Staphylococcus aureates and Streptococcus preumoniae, including treatment of wounds. The present amino acid sequence represents the Streptococcus pneumoniae fifty-four homologue (ffh) protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                 "Optionally (R2)n-Y, where R2 is any amino acid residue, n is an integer between 1 and 1000 and Y is a hydrogen or a metal"
